Hello CST8285!

Welcome!

Welcome to Web Programming! This HTML file will demonstrate how to use common HTML tags. This text is contained in a paragraph `<p>` tag. The paragraph tag is used to hold blocks of text that are not headings. You will use the `<p>` tag a lot in HTML documents.

This text is contained in a second paragraph tag. Notice that the browser automatically puts space between the two paragraphs. The amount of space may vary from browser to browser.

Lists

There are two types of lists that we will cover: ordered lists and unordered lists. An ordered list will list its items with a bullet, and an ordered list will list its items with a number.

Ordered lists

1. This is the first item.
2. This is the second item.
3. This is the third item.

Unordered lists

- This is the first item.
- This is the second item.
- This is the third item.

Links

You can make any text into a hyperlink by using the `<a>` tag, with the `href` attribute set to the webpage you wish to visit. For example, the word [Google](#) is wrapped in an `<a>` tag, and will lead you to google when clicked.

Phrase tags

Strong

Using `<strong>` tags will make text appear **bold**.

Emphasis (em)

Using `<em>` will make text appear *in italics*.

NOTE: the default appearance of the above tags can be overridden with CSS.

Special Characters

There are some characters that require the use of an html *entity*, which is a special way of displaying characters that could be mistaken for html code, such as the < and > symbols.

Examples

- > for the > character.
- < for the < character.
- & for the & character.
- " for the " character.

A full list of HTML entity tags can be found [here.](#)
